

MAINTAINING AND CLEANING YOUR RUBBER SURFACING

There are numerous ways and options available to you to protect your investment. A list of methods best suited to your applications is listed below. Select which is appropriate to your application.

- Rubber exposed to the elements can be hosed down occasionally to remove dirt and grime. Apply normal pressure via a garden hose approximately 300mm from the surface using a soft brush and biodegradable detergents if required. DO NOT use high pressure equipment or industrial sweepers fitted with harsh brushes.
- A detergent that is PH neutral is recommended. This can be a standard domestic product. ALWAYS apply a test patch first to check colour fastness
- To remove leaves, sand, tan bark, or wood chips simply sweep with a broom or use a blower. A blower is recommended for sand.
- If your rubber is installed indoors you can vacuum clean and then wipe over with a sponge type mop or cloth or use a wet & dry vacuum system.
- Chewing gum can be removed by using CRC Freeze Spray 2039. This can be purchased from leading hardware suppliers. Freeze the affected areas then remove the gum by breaking it away from the surface.

Properly maintained “RubberTough” surfaces will deliver many years of durable protection.

Call RubberTough on 1800 060 072 if you require any further information.
